

# Smart Managed *IT* Solutions *transforming your business*

## SecureWatch

### Business Challenges

As technology evolves and becomes more of a business enabler, the need for additional layers of security has become evident. While security devices such as firewalls have become a standard in data networks, the increasing sophistication of security attacks has allowed the firewall to be bypassed and internal systems to be breached.

The challenges lie with investing in resources, following security best practices, and combating security threats.

Our Security Management service is an effective solution for companies looking to optimize their security practices and protect themselves from internal and/or external threats.

### Our Security Management Solution

Our SecureWatch service has been designed to protect corporate resources and brand reputation. By leveraging End to End Networks' trained Security Professionals and

proven processes, clients can strengthen their security posture and match their IT strategy to their corporate policies and procedures.

### Our Services

- Network Management
- Security Management
- Unified Communications
- Consulting
- Wireless Solutions
- Mobile Workforce Solutions
- Governance, Risk & Compliance
- Professional Services

### eView, Our Award Winning Portal

eView is a sophisticated web-based client management portal that provides companies with a single point of entry to crucial information about their corporate IT assets. Companies can manage IT costs by using eView as a central repository to track IT assets, data telecommunications information, and manufacturer hardware and software maintenance contracts.

#### Engage with experienced Security Professionals

Finding the right talent and maintaining essential certifications can be difficult to maintain within any dynamic work environment. End to End Networks' Certified Security Professionals have the skills necessary to protect complex business foundations. Expertise is included in the following areas: Firewalling, IDP, SIM, NAC, Multi-Factor Authentication, URL Content Filtering, DLP, Ethical Hacking, and Attack Analysis.

#### Proven processes based on industry best practices

Industry best practices have played an important role around building a strong and secure infrastructure for clients. Proven processes have been based on these best practices and continuous improvement. End to End Networks management processes have successfully passed audits that were jointly conducted with companies such as Deloitte, Telus, Allstream, and Cisco.

#### Leverage leading edge security management systems

Investing, managing, and maintaining leading edge security management systems can be costly to any company. End to End Networks understands these concerns and has made these necessary investments to offer a security solution that embeds the functionality of these systems without additional capital output.

# SecureWatch

making it secure, seamless, and stress-free

## Our Security Management Solution

Our SecureWatch service includes preventative measures which have been designed to minimize security risks. It can also help you to protect your brand, business, and corporate intelligence.

**Managing Internet Threats** to both block and/or log malicious activity from internal or external agents. All traffic flowing in and out of your data network is monitored based on a predetermined set of rules that will analyze traffic patterns and alarm in the event an attack is detected.

**Monitoring Employee Web Access** is intended to identify employees misusing company resources by browsing to inappropriate and/or infected websites. Available features include blocking options, comprehensive reporting, and blocking notifications.

**7x24x365 Secure Connectivity** to corporate information which simulates an in-the-office work experience.

**Network Access Control** focuses on three key things: who, what, and where. IT policies can be evaluated to identify which staff members would have access, from where and which devices have permissible entry to the network.

**Log Aggregation** is an intelligent auditing solution that collects Syslogs from network devices, so companies can easily identify threats and attempted security breaches.

**Multi-Factor Authentication** allows companies to provide layers of authentication while accessing corporate resources. A token is provided to users to carry and this device generates a new “key” or “password” every 60 seconds.

## Value-Added Benefits

As an End to End Networks client, you will receive value-added benefits such as:

- 7x24x365 access to our Live Voice Service Desk
- Immediate detection of device failure
- Access to our award winning portal, eView
- Real-time and historical network reports
- Visibility to your live network map
- Mean Time to Repair (MTTR) for managed service products within 4 hours
- Complete visibility into managed device asset information
- Tracking of all manufacturer warranty of contracted devices in one interface
- Carrier and/or ISP coordination for troubleshooting
- Comprehensive Add/Move/Change Service
- Daily configuration captures and changes are automated and assessed by our Security Team
